

## **QUESTIONS & ANSWERS**

**The project is about waste audits, but the specifications also require to list the energy (and water) consumption of the company, and to provide energy reductions measures. Energy efficiency audits are a specialized type of audits, so it is not clear what type of energy reduction measures are asked for? Do you maybe mean waste prevention measures that also have a positive effect on energy consumption?**

*The project is about waste audits, but the specifications also require to list the energy (and water) consumption of the company, and to provide energy reductions measures.*

*Energy efficiency audits are a specialized type of audits, so it is not clear what type of energy reduction measures are asked for? Do you maybe mean waste prevention measures that also have a positive effect on energy consumption?*

*The focus of W2P is on avoiding waste streams. Thus, the measures should focus on waste avoidance and the energy savings associated with it. For example, by producing more efficiently, you will be able to save both resources and energy. It is not the intention to carry out a standard energy scan and see how much electricity and gas is used for heating, how energy can be saved and how energy consumption can be made more sustainable. The link with waste must be clear in the savings measures.*
